Introduction

Project background and context

Falcon 9 rocket launches from Space X are advertised on the company website for a price of \$62 million, while similar launches from other suppliers cost upwards of \$165 million apiece. This price difference is mostly attributable to Space X's ability to reuse the first stage. Consequently, the cost of a launch may be estimated if we know whether or not the first stage will land. This data can be utilized by competitors of space X who wish to submit bids for rocket launches. The purpose of this project is to build a machine learning pipeline to determine the likelihood of a successful first-stage landing.

Problems you want to find answers

- How do you know if the rocket will safely land?
- The complex interplay between the factors that ultimately decide a landing's success.
- What kinds of operational circumstances must be met for a landing program to be effective?

Methodology

Executive Summary

- Data collection methodology:
 - Information was gathered from the SpaceX API and Wikipedia web scraping.
- Perform data wrangling
 - One-hot encoding was applied to categorical features
- Perform exploratory data analysis (EDA) using visualization and SQL
- Perform interactive visual analytics using Folium and Plotly Dash
- Perform predictive analysis using classification models
 - How to build, tune, evaluate classification models

Data Collection

The data was collected using various methods

- Data collection was done using get request to the SpaceX API.
- Next, we decoded the response content as a Json using .json() function call and turn it into a pandas dataframe using .json_normalize().
- We then cleaned the data, checked for missing values and fill in missing values where necessary.
- In addition, we performed web scraping from Wikipedia for Falcon 9 launch records with BeautifulSoup.
- The goal was to extract the launch records as an HTML table, parse the table, and then transform the table into a dataframe for later analysis.

Data Collection - SpaceX API

API to collect data, clean the requested data and did some basic data wrangling and formatting.

The link to the notebook is https://github.com/Demarco90/IBM-Data-Science-Capstone/blob/main/DataCollectionAPI.ipynb

```
1. Get request for rocket launch data using API
          spacex url="https://api.spacexdata.com/v4/launches/past"
          response = requests.get(spacex url)
   2. Use json normalize method to convert json result to dataframe
In [12]:
           # Use json normalize method to convert the json result into a dataframe
           # decode response content as json
           static json df = res.json()
In [13]:
           # apply json normalize
           data = pd.json_normalize(static_json_df)
   3. We then performed data cleaning and filling in the missing values
In [30]:
          rows = data falcon9['PayloadMass'].values.tolist()[0]
           df rows = pd.DataFrame(rows)
          df rows = df rows.replace(np.nan, PayloadMass)
          data falcon9['PayloadMass'][0] = df rows.values
           data falcon9
```

Data Collection - Scraping

We applied web scrapping to webscrap Falcon 9 launch records with BeautifulSoup

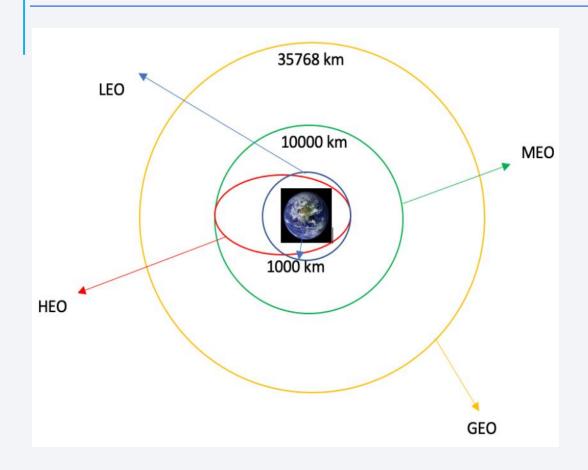

We parsed the table and converted it into a pandas dataframe.

The link to the notebook is

https://github.com/Demarco90/IBM-Data-Science-Capstone/blob/main/DataCollectionWebscraping.ipynb

```
1. Apply HTTP Get method to request the Falcon 9 rocket launch page
       static url = "https://en.wikipedia.org/w/index.php?title=List of Falcon 9 and Falcon Heavy launches&oldid=1027686922"
In [5]: # use requests.get() method with the provided static_url
          # assign the response to a object
          html data = requests.get(static url)
          html_data.status_code
   2. Create a BeautifulSoup object from the HTML response
          # Use BeautifulSoup() to create a BeautifulSoup object from a response text content
           soup = BeautifulSoup(html data.text, 'html.parser')
         Print the page title to verify if the BeautifulSoup object was created properly
          # Use soup.title attribute
           soup.title
          <title>List of Falcon 9 and Falcon Heavy launches - Wikipedia</title>
       Extract all column names from the HTML table header
         column_names = []
         # Apply find all() function with "th" element on first launch table
         # Iterate each th element and apply the provided extract column from header() to get a column name
         # Append the Non-empty column name ('if name is not None and Len(name) > \theta') into a list called column names
         element = soup.find all('th')
         for row in range(len(element)):
                name = extract_column_from_header(element[row])
                if (name is not None and len(name) > 0);
                    column names.append(name)
    4. Create a dataframe by parsing the launch HTML tables
    5. Export data to csv
```

Data Wrangling

We performed exploratory data analysis and determined the training labels.

We calculated the number of launches at each site, and the number and occurrence of each orbits

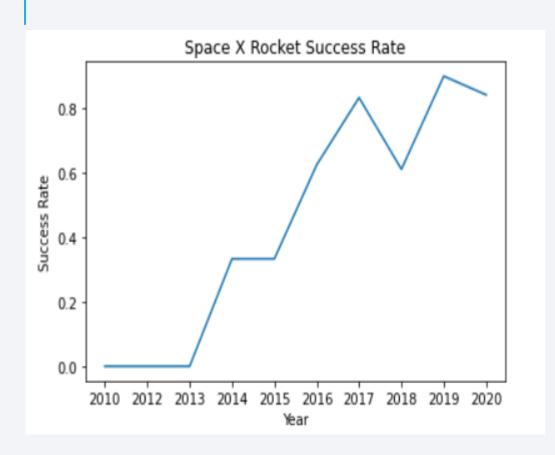

We created landing outcome label from outcome column and exported the results to csv.

The link to the notebook is

https://github.com/Demarco90/IBM-Data-Science-

Capstone/blob/main/DataWrangling.ipynb

EDA with Data Visualization

We explored the data by visualizing the relationship between flight number and launch Site, payload and launch site, success rate of each orbit type, flight number and orbit type, the launch success yearly trend.

The link to the notebook is

https://github.com/Demarco90/IB
M-Data-ScienceCapstone/blob/main/EDA DataVi
sualization.ipynb

EDA with SQL

Without leaving the Jupyter notebook, the SpaceX dataset was loaded into a PostgreSQL database.

We applied EDA with SQL to get insight from the data. We wrote queries to find out for instance:

- The names of unique launch sites in the space mission.
- The total payload mass carried by boosters launched by NASA (CRS)
- The average payload mass carried by booster version F9 v1.1
- The total number of successful and failure mission outcomes
- The failed landing outcomes in drone ship, their booster version and launch site names.

The link to the notebook is https://github.com/Demarco90/IBM-Data-Science-Capstone/blob/main/EDA_SQL.ipynb

Build an Interactive Map with Folium

Using the folium map, we identified every launch point and added map elements like markers, circles, and lines to indicate whether a launch was successful or unsuccessful for each location.

I categorize feature launch results (success or failure) into classes O and 1.0 represents failure while 1 represents success. The launch sites with a comparatively high success rate were determined using the color-labeled marker clusters.

I measured the separations between a launch facility and its environs.

I also responded to various queries, such as:

- Are launch sites near railways, highways and coastlines.
- Do launch sites keep certain distance away from cities.

Build a Dashboard with Plotly Dash

I built an interactive dashboard with Plotly dash

I plotted pie charts showing the total launches by a certain sites

I plotted scatter graph showing the relationship with Outcome and Payload Mass (Kg) for the different booster version.

The link to the notebook is https://github.com/Demarco90/IBM-Data-Science-Capstone/blob/main/spacex_dash_app.py

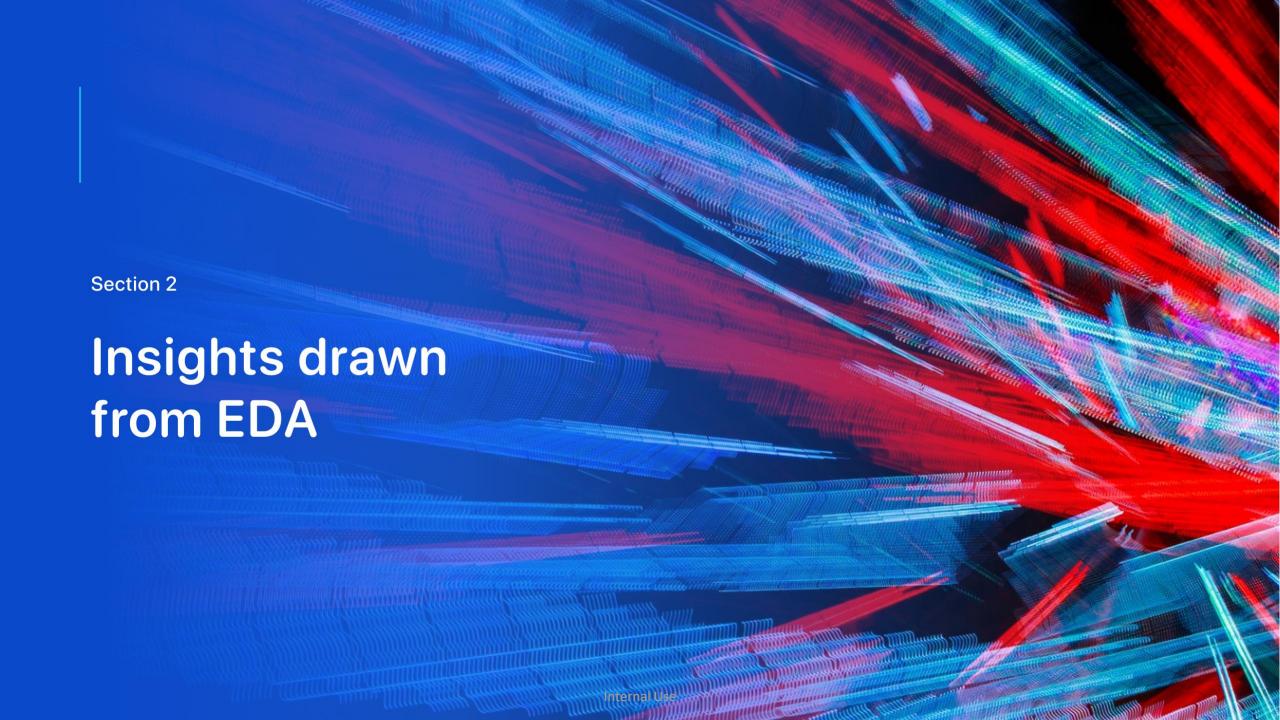

Predictive Analysis (Classification)

Using Numpy and Pandas, I loaded the data, transformed it, and divided it into training and testing sets. Using GridSearchCV, I constructed various machine learning models and tuned various hyperparameters. The model was measured by accuracy, and it was enhanced through feature engineering and algorithm tweaking. The most effective classification model was discovered.

The link to the notebook is https://github.com/Demarco90/IBM-Data-Science-Capstone/blob/main/Machine%20Learning%20Prediction.ipynb

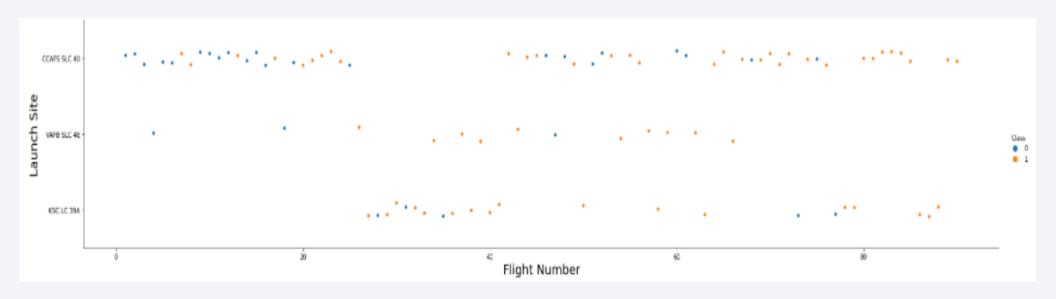

Results

- Exploratory data analysis results
- Interactive analytics demo in screenshots
- Predictive analysis results

Flight Number vs. Launch Site

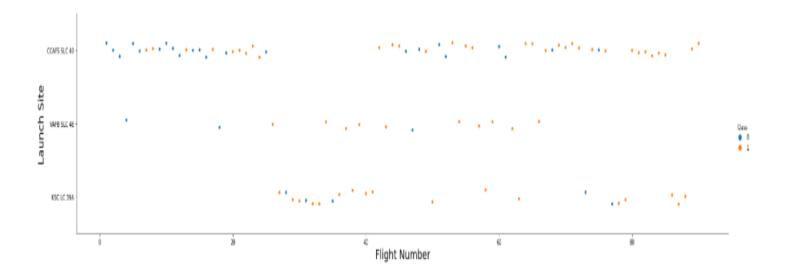

From the plot, we found that the larger the flight amount at a launch site, the greater the success rate at a launch site.

Payload vs. Launch Site

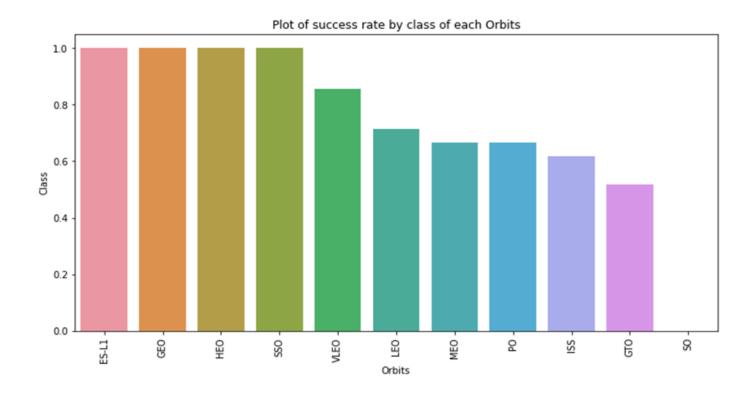

The greater the payload mass for launch site CCAFS SLC 40 the higher the success rate for the rocket.

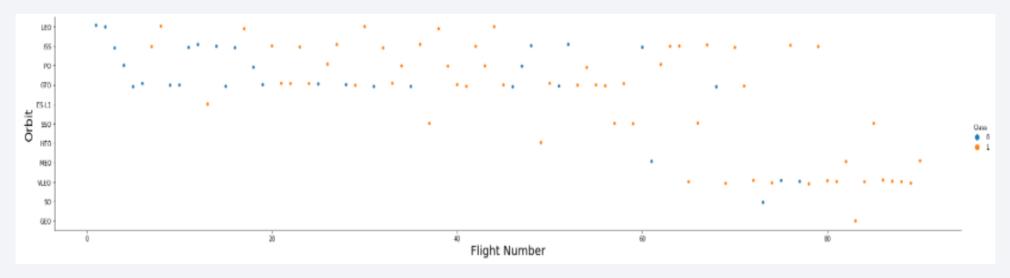

Success Rate vs. Orbit Type

From the plot, we can see that ES-L1, GEO, HEO, SSO, VLEO had the most success rate.

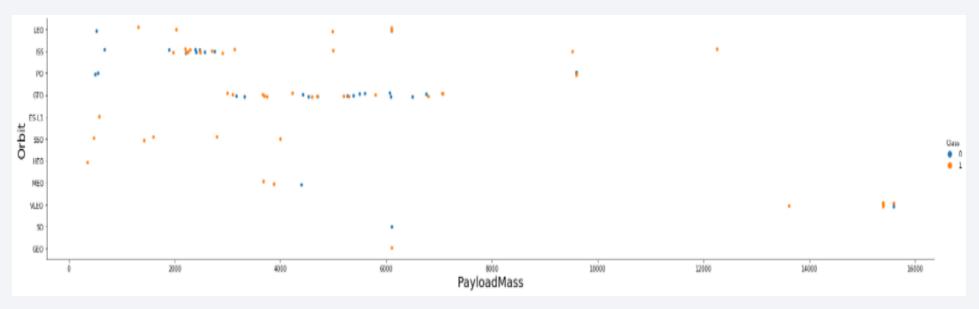

Flight Number vs. Orbit Type

The plot below shows the Flight Number vs. Orbit type. We observe that in the LEO orbit, success is related to the number of flights whereas in the GTO orbit, there is no relationship between flight number and the orbit.

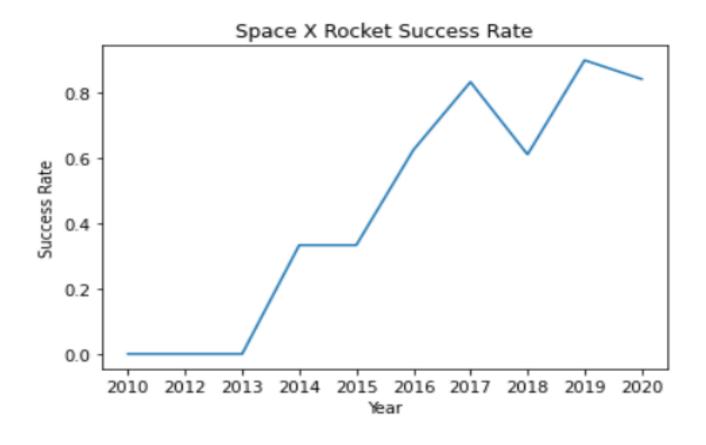

Payload vs. Orbit Type

We can observe that with heavy payloads, the successful landing are more for PO, LEO and ISS orbits.

Launch Success Yearly Trend

As seen on the plot, one can observe that success rate has been increasing since the year 2013 up until the year 2020.

All Launch Site Names

We used the key word DISTINCT to show only unique launch sites from the SpaceX data.

Display the names of the unique launch sites in the space mission

```
Out[10]: launchsite

0 KSC LC-39A

1 CCAFS LC-40

2 CCAFS SLC-40

3 VAFB SLC-4E
```

Launch Site Names Begin with 'CCA'

Display 5 records where launch sites begin with the string 'CCA' In [11]: task_2 = ''' SELECT * FROM SpaceX WHERE LaunchSite LIKE 'CCA%' LIMIT 5 1.1.1 create pandas df(task 2, database=conn) Out[11]: time boosterversion launchsite payload payloadmasskg orbit customer missionoutcome landingoutcome CCAFS LC-Failure 18:45:00 F9 v1.0 B0003 Dragon Spacecraft Qualification Unit LEO 0 SpaceX Success (parachute) Dragon demo flight C1, two CubeSats, barrel NASA (COTS) CCAFS LC-LEO Failure 15:43:00 F9 v1.0 B0004 0 Success (ISS) NRO (parachute) CCAFS LC-LEO F9 v1.0 B0005 Dragon demo flight C2 525 NASA (COTS) Success No attempt CCAFS LC-LEO F9 v1.0 B0006 SpaceX CRS-1 500 NASA (CRS) Success No attempt (ISS) CCAFS LC-15:10:00 F9 v1.0 B0007 SpaceX CRS-2 677 NASA (CRS) Success No attempt

Total Payload Mass

We calculated the total payload carried by boosters from NASA as 45596 using the query below

```
Display the total payload mass carried by boosters launched by NASA (CRS)

In [12]:

task_3 = '''

SELECT SUM(PayloadMassKG) AS Total_PayloadMass
FROM SpaceX
WHERE Customer LIKE 'NASA (CRS)'

'''

create_pandas_df(task_3, database=conn)

Out[12]:

total_payloadmass

0 45596
```

Average Payload Mass by F9 v1.1

Display average payload mass carried by booster version F9 v1.1

```
In [13]:
    task_4 = '''
        SELECT AVG(PayloadMassKG) AS Avg_PayloadMass
        FROM SpaceX
        WHERE BoosterVersion = 'F9 v1.1'
        '''
        create_pandas_df(task_4, database=conn)
```

Out[13]: avg_payloadmass

0 2928.4

First Successful Ground Landing Date

It can be observed that the dates of the first successful landing outcome on ground pad was 22nd December 2015

Successful Drone Ship Landing with Payload between 4000 and 6000

We used the WHERE clause to filter for boosters which have successfully landed on drone ship and applied the AND condition to determine successful landing with payload mass greater than 4000 but less than 6000

Out[15]: boosterversion 0 F9 FT B1022 1 F9 FT B1026 2 F9 FT B1021.2 3 F9 FT B1031.2

Total Number of Successful and Failure Mission Outcomes

List the total number of successful and failure mission outcomes

```
In [16]:
          task 7a = '''
                  SELECT COUNT(MissionOutcome) AS SuccessOutcome
                  FROM SpaceX
                  WHERE MissionOutcome LIKE 'Success%'
          task 7b = '''
                  SELECT COUNT(MissionOutcome) AS FailureOutcome
                  FROM SpaceX
                  WHERE MissionOutcome LIKE 'Failure%'
          print('The total number of successful mission outcome is:')
          display(create pandas df(task 7a, database=conn))
          print()
          print('The total number of failed mission outcome is:')
          create pandas df(task 7b, database=conn)
         The total number of successful mission outcome is:
            successoutcome
         0
                      100
         The total number of failed mission outcome is:
            failureoutcome
Out[16]:
         0
```

Boosters Carried Maximum Payload

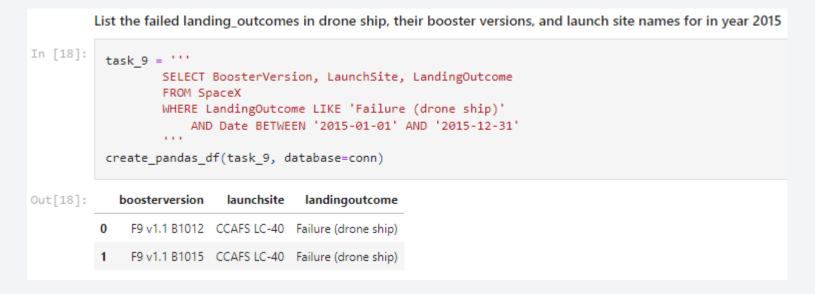

We determined the booster that have carried the maximum payload using a subquery in the WHERE clause and the MAX() function.

List the names of the booster_versions which have carried the maximum payload mass. Use a subquery In [17]: task 8 = ''' SELECT BoosterVersion, PayloadMassKG FROM SpaceX WHERE PayloadMassKG = (SELECT MAX(PayloadMassKG) FROM SpaceX ORDER BY BoosterVersion create_pandas_df(task_8, database=conn) Out[17]: boosterversion payloadmasskg F9 B5 B1048.4 15600 F9 B5 B1048.5 15600 F9 B5 B1049.4 15600 F9 B5 B1049.5 15600 F9 B5 B1049.7 15600 F9 B5 B1051.3 15600 F9 B5 B1051.4 15600 F9 B5 B1051.6 15600 F9 B5 B1056.4 15600 F9 B5 B1058.3 15600 F9 B5 B1060.2 15600 F9 B5 B1060.3 15600 11

31

2015 Launch Records

We used a combinations of the WHERE clause, LIKE, AND, and BETWEEN conditions to filter for failed landing outcomes in drone ship, their booster versions, and launch site names for year 2015

Rank Landing Outcomes Between 2010-06-04 and 2017-03-20

Rank the count of landing outcomes (such as Failure (drone ship) or Success (ground pad))

```
In [19]:
    task_10 = '''
        SELECT LandingOutcome, COUNT(LandingOutcome)
        FROM SpaceX
        WHERE DATE BETWEEN '2010-06-04' AND '2017-03-20'
        GROUP BY LandingOutcome
        ORDER BY COUNT(LandingOutcome) DESC
        '''
    create_pandas_df(task_10, database=conn)
```

 No attempt 10 Success (drone ship) 6 Failure (drone ship) 5 Success (ground pad) 5 Controlled (ocean) 3 Uncontrolled (ocean) 2 Precluded (drone ship) 1 Failure (parachute) 1 	ut[19]:		landingoutcome	count
2 Failure (drone ship) 5 3 Success (ground pad) 5 4 Controlled (ocean) 3 5 Uncontrolled (ocean) 2 6 Precluded (drone ship) 1		0	No attempt	10
3 Success (ground pad) 5 4 Controlled (ocean) 3 5 Uncontrolled (ocean) 2 6 Precluded (drone ship) 1		1	Success (drone ship)	6
4 Controlled (ocean) 3 5 Uncontrolled (ocean) 2 6 Precluded (drone ship) 1		2	Failure (drone ship)	5
5 Uncontrolled (ocean) 2 6 Precluded (drone ship) 1		3	Success (ground pad)	5
6 Precluded (drone ship) 1		4	Controlled (ocean)	3
		5	Uncontrolled (ocean)	2
7 Failure (parachute) 1		6	Precluded (drone ship)	1
		7	Failure (parachute)	1

We selected Landing outcomes and the COUNT of landing outcomes from the data and used the WHERE clause to filter for landing outcomes BETWEEN 2010-06-04 to 2010-03-20.

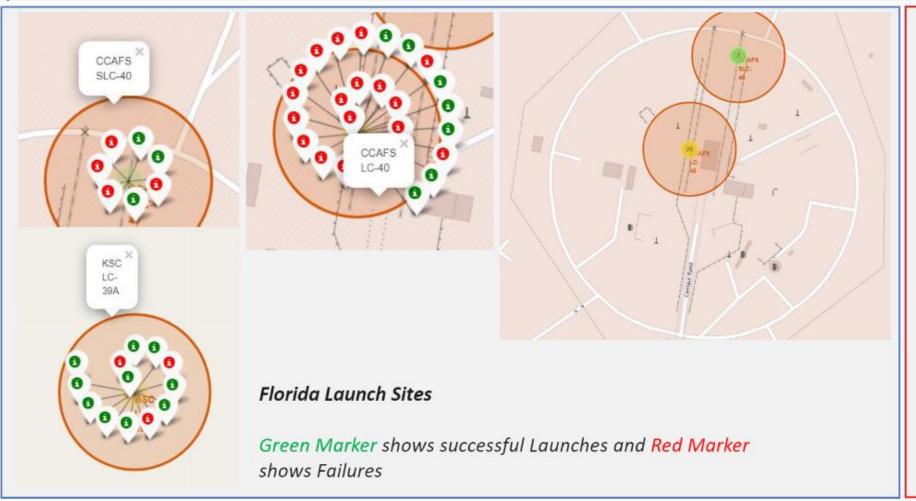

We applied the **GROUP BY** clause to group the landing outcomes and the **ORDER BY** clause to order the grouped landing outcome in descending order.

Section 4 **Launch Sites Proximities Analysis**

All launch sites global map markers

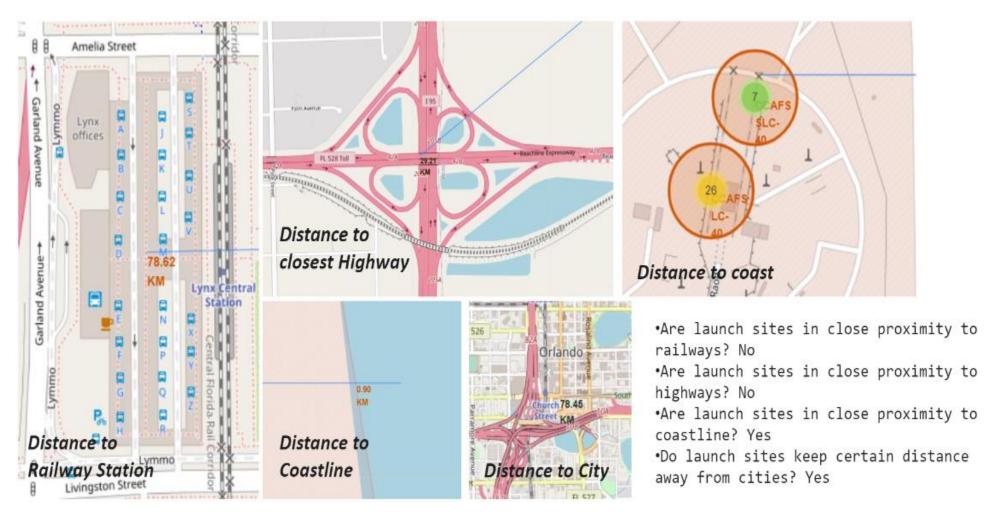

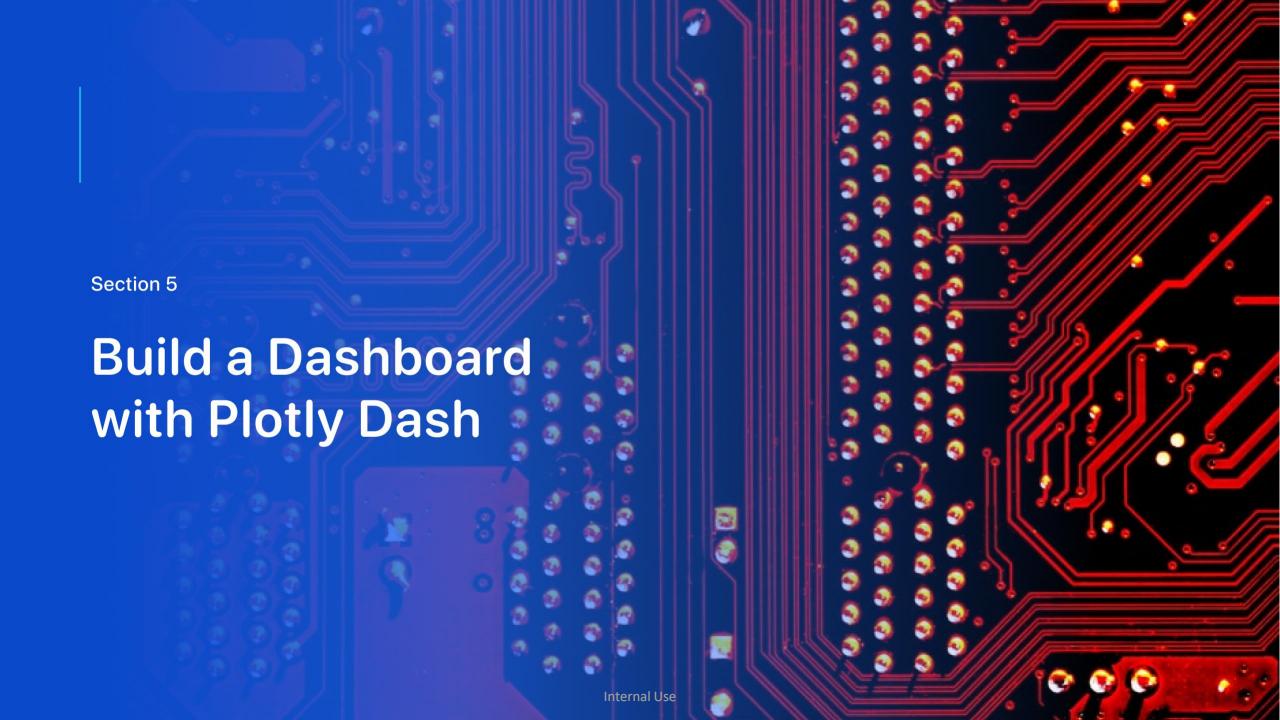

Markers showing launch sites with color labels

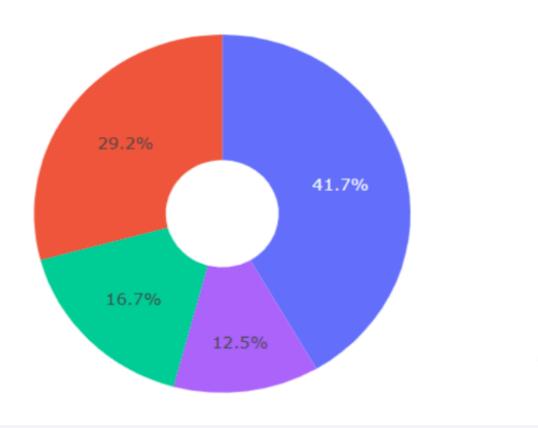

Launch Site distance to landmarks

Pie chart showing the success percentage achieved by each launch site

KSC LC-39A

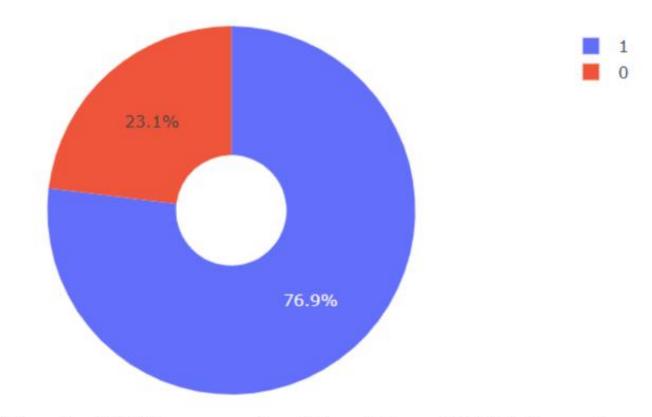

CCAFS LC-40

VAFB SLC-4E

CCAFS SLC-40

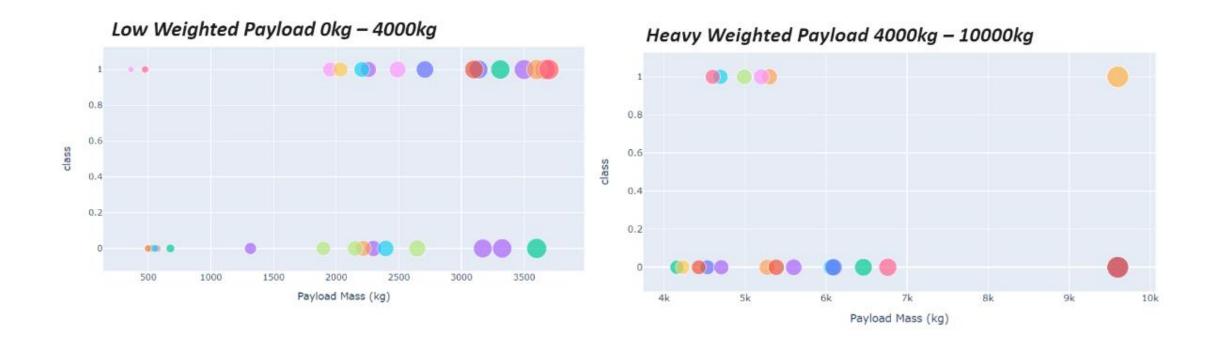

We can see that KSC LC-39A had the most successful launches from all the sites

Pie chart showing the Launch site with the highest launch success ratio

KSC LC-39A achieved a 76.9% success rate while getting a 23.1% failure rate

Scatter plot of Payload vs Launch Outcome for all sites, with different payload selected in the range slider

We can see the success rates for low weighted payloads is higher than the heavy weighted payloads

Section 6 **Predictive Analysis** (Classification)

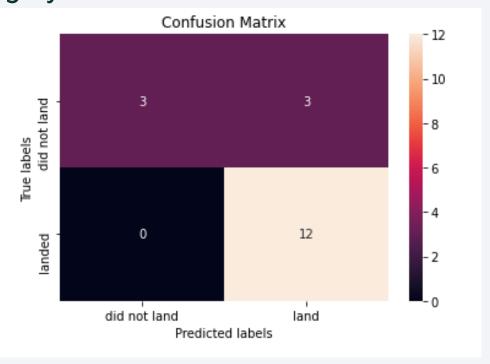

Classification Accuracy

The decision tree classifier is the model with the highest classification accuracy

```
models = {'KNeighbors':knn_cv.best_score_,
               'DecisionTree':tree cv.best score ,
               'LogisticRegression':logreg cv.best score ,
               'SupportVector': svm cv.best score }
 bestalgorithm = max(models, key=models.get)
 print('Best model is', bestalgorithm,'with a score of', models[bestalgorithm])
 if bestalgorithm == 'DecisionTree':
     print('Best params is :', tree cv.best params )
 if bestalgorithm == 'KNeighbors':
     print('Best params is :', knn cv.best params )
 if bestalgorithm == 'LogisticRegression':
     print('Best params is :', logreg cv.best params )
 if bestalgorithm == 'SupportVector':
     print('Best params is :', svm cv.best params )
Best model is DecisionTree with a score of 0.8732142857142856
Best params is : {'criterion': 'gini', 'max depth': 6, 'max features': 'auto', 'min samples leaf': 2, 'min samples split': 5, 'splitter': 'random'}
```

Confusion Matrix

The confusion matrix for the decision tree classifier shows that the classifier can distinguish between the different classes. The major problem is the false positives .i.e., unsuccessful landing marked as successful landing by the classifier.

Conclusions

We can conclude that:

The larger the flight amount at a launch site, the greater the success rate at a launch site.

Launch success rate started to increase in 2013 till 2020.

Orbits ES-L1, GEO, HEO, SSO, VLEO had the most success rate.

KSC LC-39A had the most successful launches of any sites.

The Decision tree classifier is the best machine learning algorithm for this task.
